

SUCCESS SECRETS WITH ALEX

Mini-Project: Build your First Automation in Make **SHERIN MARY P.J**

Google Sheets + Gmail Automation

This automation is created using **Make.com** to connect **Google Sheets and Gmail**.

The main purpose of this automation is to **automatically send an email using the information stored in Google Sheets**.

How it works

1. **Google Sheets** – The required information is entered and stored in a Google Sheet.
2. **Make.com** – Make.com checks the Google Sheet and gets the required information.
3. **Gmail** – Make.com uses that information to create and send an email automatically.
4. **Email Sent** – The email is delivered without manually copying the information from the sheet to Gmail.

Workflow:

Google Sheets → Make.com → Gmail → Automatic Email

What I learned

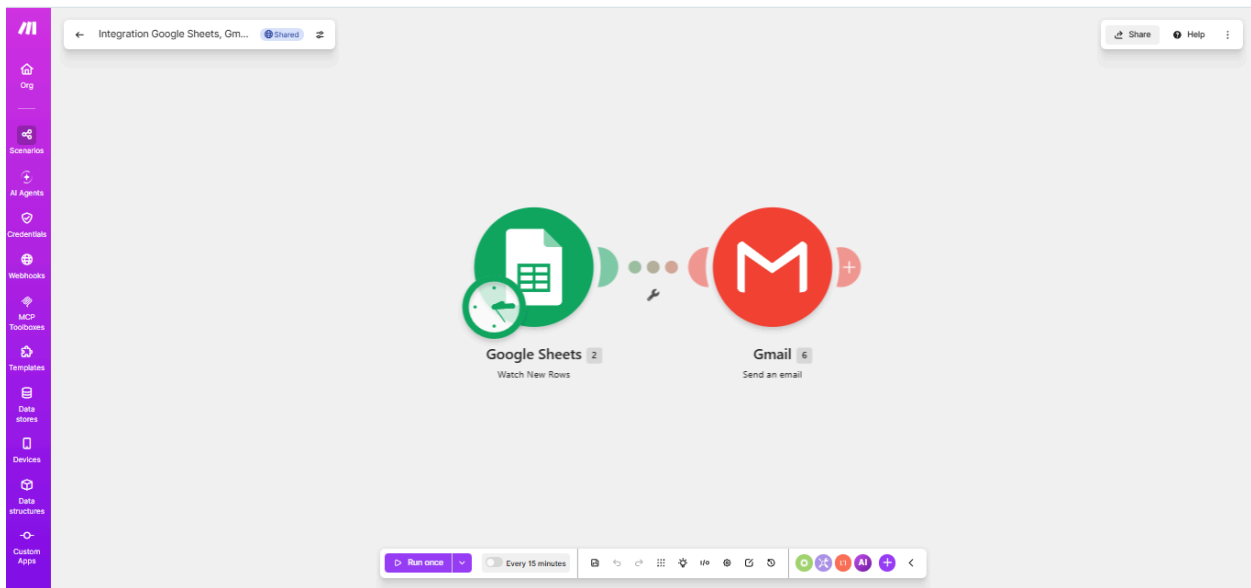

Through this project, I learned how to:

- Connect different applications using **Make.com**
- Create an **automation workflow**
- Use **triggers and actions**
- Transfer data from one application to another using **data mapping**
- Automate repetitive email tasks
