

My Automation Journey with Make.com

I'm excited to share one of my first automation projects I created using **Make.com**

I built an automation that connects **Google Sheets and Gmail**. The goal was to understand how different applications can communicate with each other and automate repetitive tasks without doing everything manually.

What I learned:

- How automation workflows work
- How to connect different applications in Make.com
- How to use Google Sheets as a trigger/source
- How to automate Gmail actions
- How to map data from one module to another
- How small tasks can be connected together to create a complete workflow

How I started my journey:

I started by exploring automation tools and understanding how they can make everyday tasks easier. Then I began experimenting with **Make.com**, learning step by step by creating small workflows.

At first, understanding triggers, actions, connections and data mapping was a little confusing. But by experimenting and troubleshooting each step, I slowly started understanding how everything works together.

This automation is just a small beginning, but it has given me a better understanding of **workflow automation and integrations**.

Check out my automation:

Looking forward to building more interesting automations and learning along the way! 🚀
